

DOES IT HURT?

No. Fibroblast treatment is a non-surgical solution for skin tightening. There is no pain associated with this procedure, though some patients may feel a minimal amount of discomfort.

A topical numbing cream is applied to the treatment area before the procedure.

HOW LONG WILL THE RESULTS TAKE TO SHOW UP?

You should notice results immediately after your appointment. As cell turnover occurs and the production of collagen increases, you'll notice further changes to your skin.

You should expect to see the full results of your treatment after around three months.

Fibroblast procedure results typically last for one-three years. Depending on your skin type, sun and pollutant exposure, skincare and up keep regimen .

Call/text Shelly @ 315-842-2056

The required consultation is a \$25 fee which will be deducted from end of treatment total.

\$200 booking deposit required.

See image for pricing details.

ARE THERE SIDE EFFECTS?

Immediately after the Fibroblast procedure, you may notice that your skin is red and slightly swollen. This is normal and should subside in around three days. Though you may see a slight redness lingering for up to 14 days.

While the procedure is underway, carbon crusts form on the skin. You should avoid the urge to touch these crusts post-procedure. You can expect them to last around a week. They'll naturally lift off as new skin appears underneath the treated area.

When you consider that you're getting a skin tightening solution without the need for surgery, these side effects are much easier to swallow.

WHAT IS FIBROBLASTING?

Fibroblast skin tightening is a revolutionary new procedure. It provides an alternative to skin tightening without necessitating surgical procedures. Fibroblasting utilizes plasma micro beads to trigger the production of collagen and elastin, two essential components for healthy, firm skin.

An electric handheld device called a plasma Fibroblast pen is used for the procedure. This pen uses a metal probe to ionize atmospheric gas between its tip and the gasses that the skin naturally emits. This forms a plasma charge.

An electrical arc is then created, shrinking the targeted skin. Your tissues will retract and tighten, providing you with a more youthful-looking appearance. Skin elasticity and tightening will continue to improve as time goes on post-treatment, and your skin continues to heal and repair.

The arc causes superficial damage to the upper dermal layer of skin and transmits heat to the lower levels of skin.

HOW LONG IS THE TREATMENT

Fibroblast treatment length will depend upon the size of the area that's being treated. You can expect the procedure to take anywhere between an hour and three hours.

A topical numbing cream will be applied before your treatment and given forty minutes to take full effect. You'll also be given a healing balm and strict instructions after your procedure to help in the healing process.

WHAT IS THE HEALING PROCESS LIKE

The small dots will scab over and typically begin falling off the week after treatment. As your skin continues to heal, it will appear tighter and firmer.
